

High-Fidelity Deployment of Microservices

Samantha Wong, GovTech

Thought Experiment

You might have:
deployment fatigue

Common Complaints

- **Feature Lockstep**: All features under development must be deployed at the same time to any new environment
- **Feature Dysmorphia**: Features that worked on lower environments do not work on Production
- **Bug Proliferation**: New features introduce new bugs
- **Environment Failure**: Deployment of new features prevents existing users from accessing application

Common Complaints

- **Feature Lockstep**: All features under development must be deployed at the same time to any new environment
- **Feature Dysmorphia**: Features that worked on lower environments do not work on Production
- **Bug Proliferation**: New features introduce new bugs
- **Environment Failure**: Deployment of new features prevents existing users from accessing application

Group Goals

- Select **what** features go out, and **when**
- Confidence about **deployment into Production** environment
 - Ability to test in *multiple* environments
 - Ability to *rollback* to one previous state
- **Zero downtime** during deployment

Group Goals

- Select **what** features go out, and **when**
- Confidence about **deployment into Production** environment
 - Ability to *rollback* to one previous state
- **Zero downtime** during deployment

Problem Solving

- Feature Lockstep

- Select **what** features go out, and **when**

- **Environment Branching**

- Feature Dysmorphia
- Bug Proliferation

- Confidence about **deployment into Production** environment
 - Ability to test in *multiple* environments
 - Ability to *rollback* to one previous state

- **Canary Deployment**

- Environment Failure

- **Zero downtime** during deployment

- **Blue-Green Deployment**

Environment Branching

Happy Confluence with our Card Workflow

Ready for Dev	In Dev	Ready for Test	In Test	Ready for PO Sign-Off	Ready for Production Deploy	Done
	dev	uat		staging	prep	prod

Why do we care?

- Ability to work on multiple cards
 - At different stages/environments of development
- Ability to choose which cards go out
- Ability to react to production issues

What are our goals?

- Reduce complexity
- Production state is the same as states on at least one lower environment
 - Testing of any state that would go to Production on lower environments

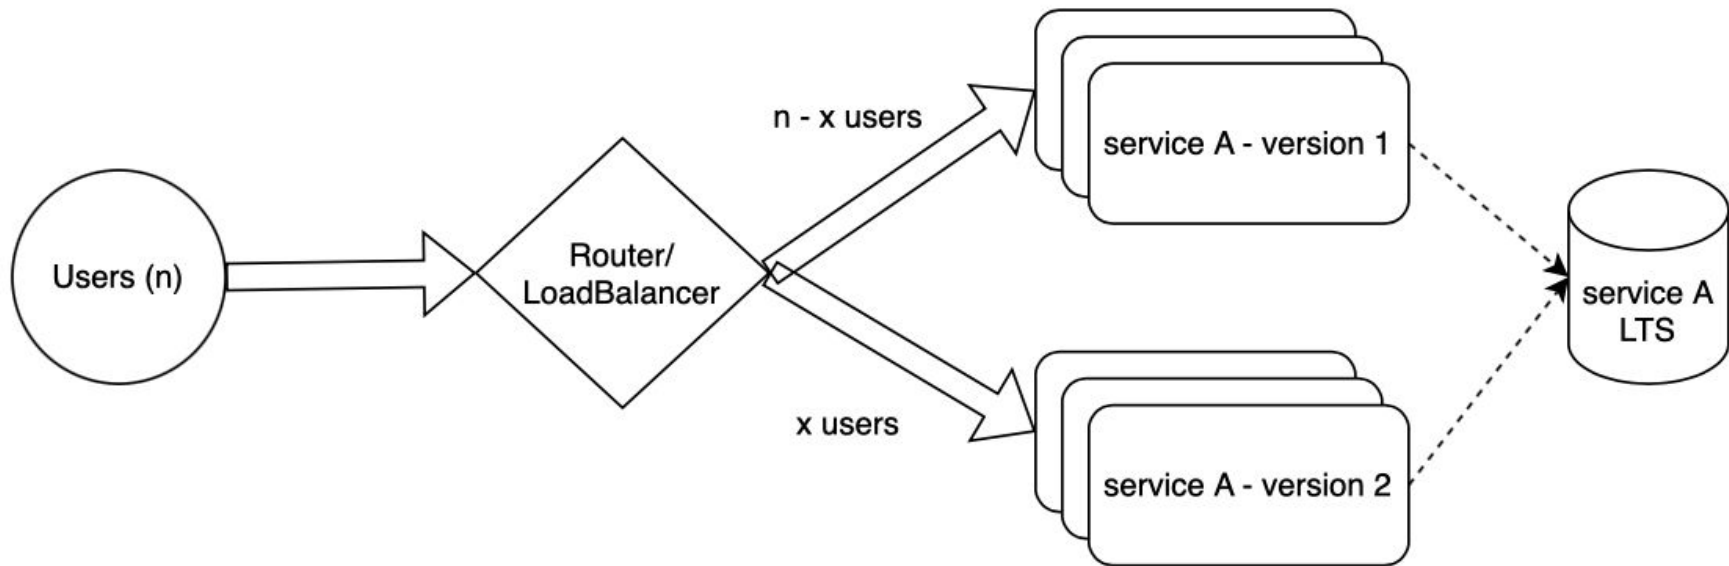

Group Goals

- Select **what** features go out, and **when**
- Confidence about **deployment into Production** environment
 - Ability to test in *multiple* environments
 - Ability to *rollback* to one previous state
- **Zero downtime** during deployment

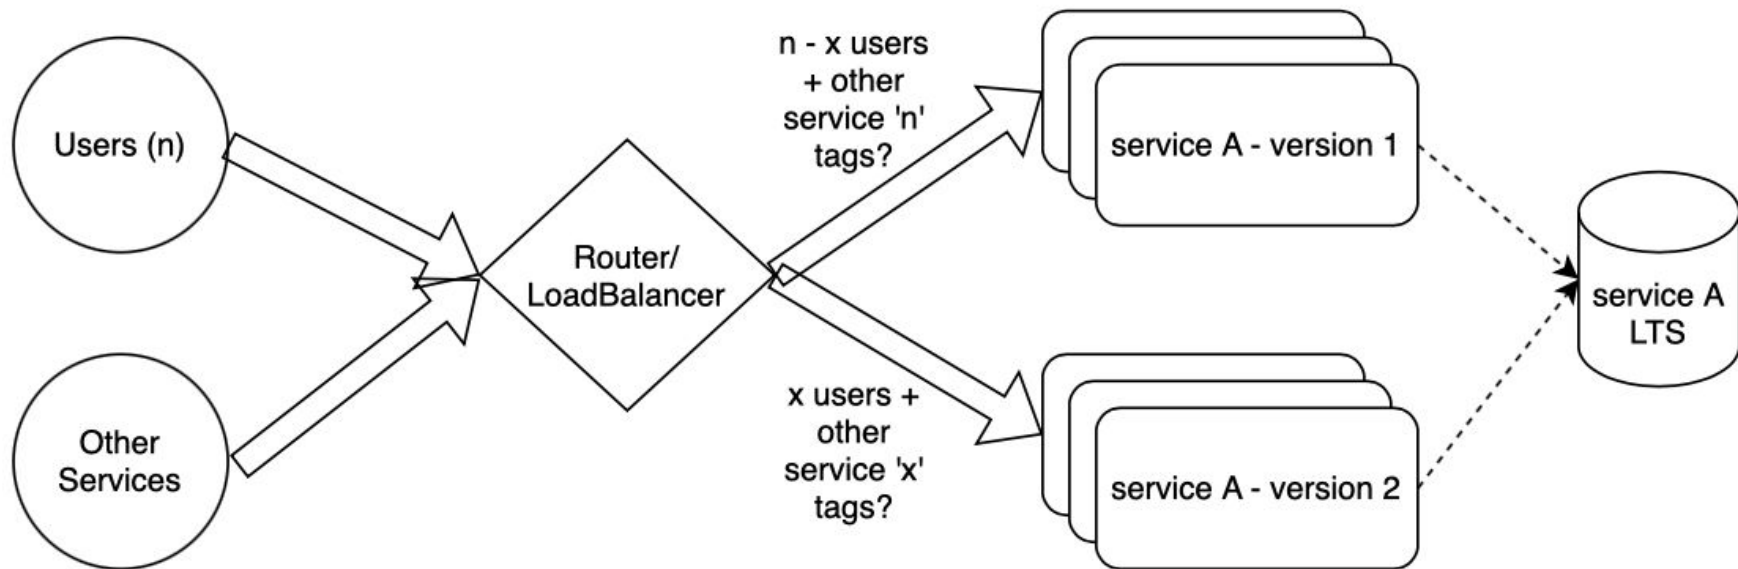

Rather than explicit
Release Cycles, the
Sprint Cycle is the
Release Cycle

Canary (Holding) Deployment

A new feature or
product version is
rolled out to a **subset**
of users in Production

Typically, it looks like so

Problems come when you have microservices

Typical Microservice Mesh

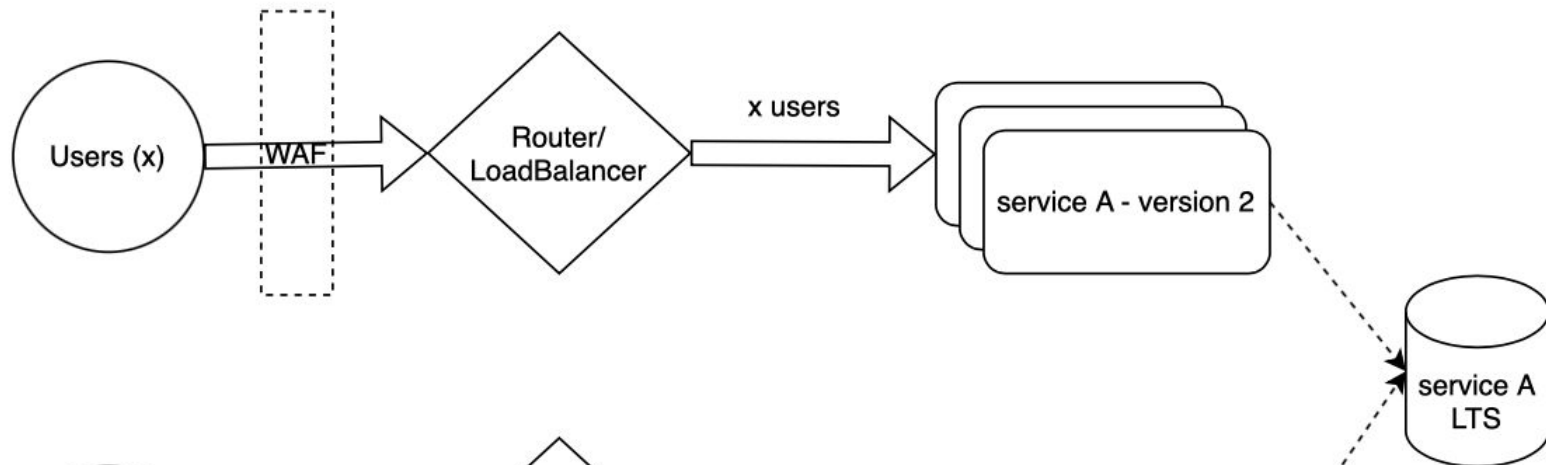

prep

prod

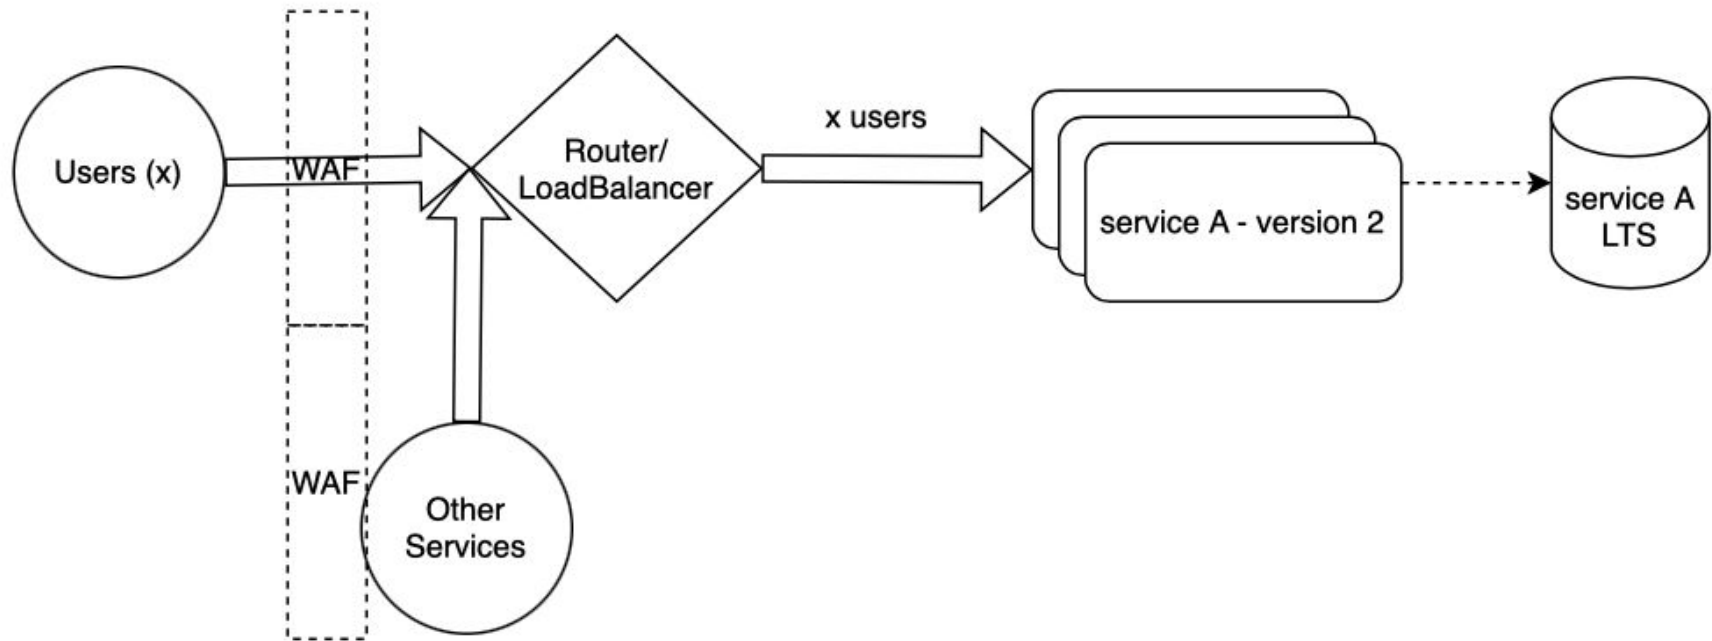

prep

prod

Group Goals

- Select **what** features go out, and **when**
- Confidence about **deployment into Production** environment
 - Ability to test in *multiple* environments
 - Ability to *rollback* to one previous state
- **Zero downtime** during deployment

Group Goals

- Select **what** features go out, and **when**
- Confidence about **deployment into Production** environment
 - Ability to test in *multiple* environments
 - Ability to *rollback* to one previous state
- **Zero downtime** during deployment

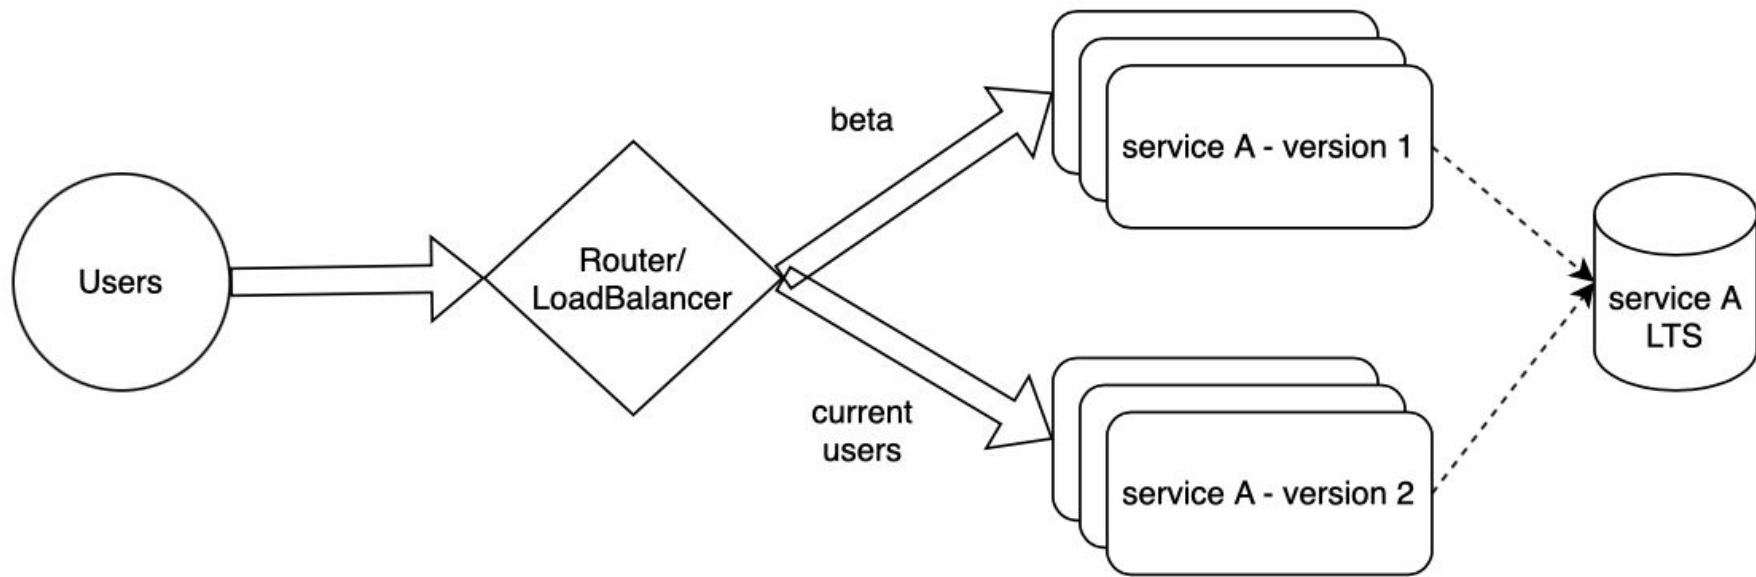

Blue-Green Deployment

Start with your original load

Deploy a new stack, hook up with live load balancer

Swap routing

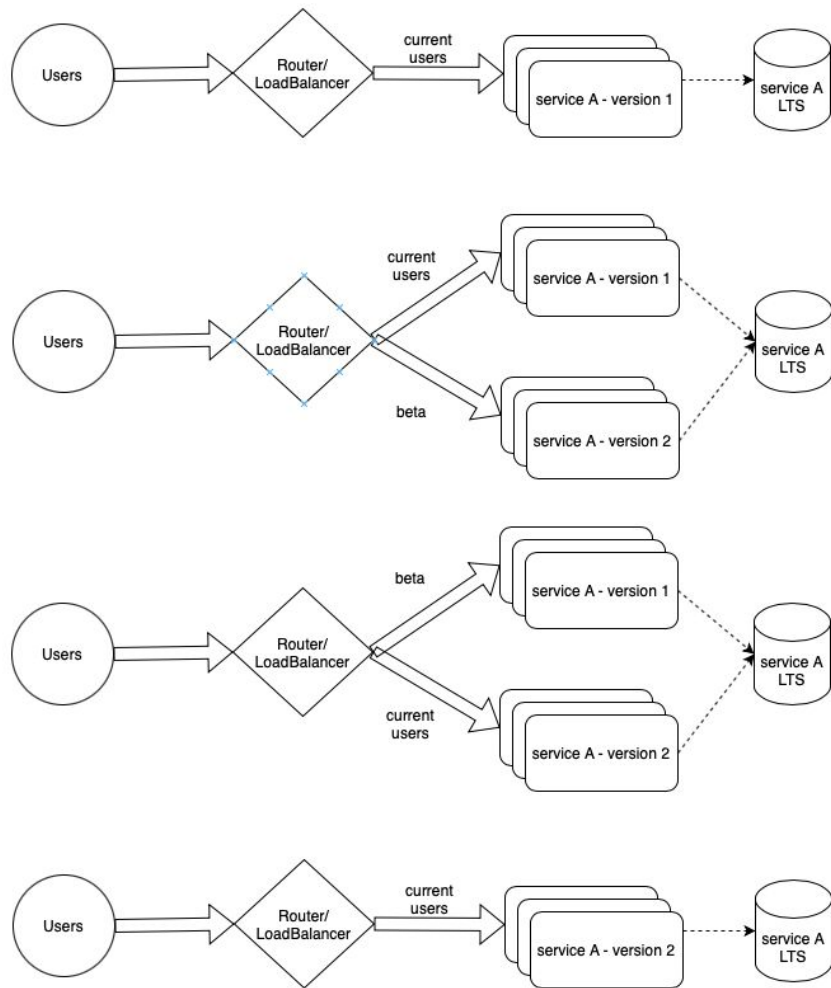

Delete previous stack

Blue-Green Lifecycle

From A to Z

- Confidence about **deployment into Production** environment
 - Ability to test in *multiple* environments
 - Ability to *rollback* to one previous state
- **Zero downtime** during deployment

Acknowledgements

Behind every presentation is a team.

My bosses Steven, Chris and Saiful for providing the opportunity to tackle these questions.

My team, Dashboard in GoBusiness for working through these problems alongside me.

That's it, folks
